
Every Token of `cl100k_base` in `tiktoken`

Z. Cheng
marc.cheng@alumni.utoronto.ca

Abstract

We enumerate every token in `cl100k_base` using `tiktoken`.

1 Introduction

`cl100k_base` is the tokenizer underlying GPT-4 [1] and related models. It has 100,277 tokens [2]. We list them.

2 Background

Byte Pair Encoding [3] produces a vocabulary by iteratively merging the most frequent byte pair in a training corpus until a target vocabulary size is reached.

3 Methodology

Each integer $i \in [0, 100,276]$ was mapped to its corresponding byte sequence, then decoded as UTF-8 where possible. Time complexity is $O(n)$. Space complexity is $O(n)$.

Tokens that are not valid UTF-8 in isolation are displayed as raw byte literals; special tokens and unassigned IDs are annotated accordingly.

4 Findings

The training corpus is mostly English.

5 Conclusion

The vocabulary is finite.

Acknowledgments

The author thanks the vocabulary for being finite.
